Plasmatic implosion reactor (PIR) 1

First
version of
our
implosion
reactor is
planned as
spherical
chamber
with
magnetic
fluid which
is driven
by an
external
rotor in a

form of rotating pulsing magnetic field from a toroidal coil.

Temperature sensors, magnetic field sensors and voltmeters inside the chamber will enable monitoring of current conditions along with cameras. Everything will be controlled by our SenseLab software.

Main thought is that we will create pulsing vortex in a magnetic fluid inside the chamber. That is what will coil with pulsing magnetic field be used for. When the frequency of the pulses will be the same as frequency of aetheric flows (sub-atomic vortical particles) nearby, then the flows (particles) will be attracted and centered or imploded in reactor's vortex for futher use in real life:

As a source of energetic materials, energy and aetheric drive, benefical effect on health, etc.

It is a research of fluid implosion, including aether (primary substance)...

As Mr. Tesla said if aether has dynamic character, then there is a chance to use its energy.

And for me it is so, that this aether, primary substance, quantuum vacuum, akasha, prana, od, orgon, ... is dynamic and its movement can be concentrated for futher use...
